

# Part III — Statistics

Based on lectures by Brian  
Notes taken by Dexter Chua

Lent 2017-2018

These notes are not endorsed by the lecturers, and I have modified them (often significantly) after lectures. They are nowhere near accurate representations of what was actually lectured, and in particular, all errors are almost surely mine.

# 1 Representation and summary of data - location

## 1.1 Basic Concepts of Variable

**Definition** (Quantitative variables and Qualitative variables). Quantitative variable associated with numerical observation. Qualitative variables associated with non-numerical observations.

**Definition** (Continuous variable and discrete variable). Continuous variable can take any value in given range. Discrete can take only specific values in a given range.

## 1.2 Grouped data

**Definition** (Grouped data). The groups are more commonly known as classes.

- class boundaries.
- mid-point of a class.
- class width.

**Example.** Example 5-6

**Definition** (Frequency and cumulative frequency). Number of anything; example is how many sheep. It is sometimes helpful to add a column to the table showing the running total of the frequencies. This is called the cumulative frequency

**Definition** (Ungrouped data). Show all data

## 1.3 Mean , mode and median

**Definition** (Mode). The mode is the value that occurs most often

**Definition** (Median).  $n/2$  term or 1 term above

**Definition** (Mean).

$$\bar{x} = \frac{\sum_i^n x_i}{n}$$

## 1.4 Linear interpolation

**Example.** Example 14-15

## 1.5 Coding

**Example.** pick 1 example

## 2 Representation and summary of data - measures of dispersion

### 2.1 Range and interquartile range

The list of formula:

$$\text{Range} = \text{Upper value} - \text{Lowest value}$$

**Example.** example 3

### 2.2 Percentiles split the data into 100 parts

**Example.** example 4

### 2.3 Range and Interquartile range

**Example** (Linear Interpolation).

### 2.4 Variance and standard deviation

**Definition** (Variance). Let  $f$  stand for the frequency, then  $n = \sum f$  and

$$\text{Variance} = \frac{\sum f(x - \bar{x})^2}{\sum f} \text{ or } \frac{\sum fx^2}{\sum f} - \left( \frac{\sum fx}{\sum f} \right)^2$$

### 2.5 Variance and standard deviation for grouped data

**Definition.**

**Example.** example 7-8

### 2.6 Coding

**Example.** example 9-11

### 3 Representation of data

#### 3.1 Stem and Leaf diagrams

#### 3.2 Outlier

**Definition.** An outlier is an extreme value that lies outside the overall pattern of the data.

An outlier is any value, which is

greater than the upper quartile +  $1.5 \times$  interquartile range

OR

less than the lower quartile +  $1.5 \times$  interquartile range

#### 3.3 Box plot

#### 3.4 Histogram

**Definition** (Frequency density).

$$\text{frequency density} = \frac{\text{frequency}}{\text{class width}}$$

**Example.** 7

#### 3.5 Skewness (Shape)

A distribution can be symmetrical, have positive skew or have negative skew

symmetrical  $Q_2 - Q_1 = Q_3 - Q_2$  or mode=median=mean

positive :  $Q_2 - Q_1 < Q_3 - Q_2$  or mode < median < mean

negative :  $Q_2 - Q_1 > Q_3 - Q_2$  or mode > median > mean

Or you can calculate:

$$\frac{3(\text{mean} - \text{median})}{\text{SD}}$$

### 3.6 What!?

**Example.** example 10-12

## 4 Probability

### 4.1 Classical Probability

### 4.2 Venn diagram and their rules

**Definition** (Complementary Probability).

### 4.3 Conditional Probabilities

#### 4.3.1 Venn diagram

#### 4.3.2 Tree diagram

### 4.4 Special Events of Probabilities

**Definition** (Mutually exclusive). When events have no outcomes in common, they are mutually exclusive.

There is no intersection of A and B, so  $P(A \cap B) = 0$

We can use  $P(A \cup B) = P(A) + P(B) - P(A \cap B)$   
result is

$$P(A \cup B) = P(A) + P(B)$$

**Definition** (Independent events). When one event has no effect on another, they are independent so  $P(A|B) = P(A)$

by  $\frac{P(A \cap B)}{P(B)} = P(A)$  we have:

$$P(A \cap B) = P(B) \times P(A)$$

## 5 Correlation

### 5.1 Correlation

### 5.2 Bivariate data

Recall this formula :

$$\text{Variance} = \frac{\sum (x - \bar{x})^2}{n}$$

In correlation we write:

$$S_{xx} = \sum (x - \bar{x})^2$$

$$S_{yy} = \sum (y - \bar{y})^2$$

so

$$\text{Variance} = \frac{S_{xx}}{n}$$

**Definition** (Co-Variance).

$$S_{xy} = \frac{\sum (x - \bar{x})(y - \bar{y})}{n}$$

### 5.3 Product moment Correlation coefficient $r$

$$r = \frac{S_{xy}}{\sqrt{S_{xx}S_{yy}}}$$

The value of  $r$  varies between -1 and 1

If  $r = 1$  , positive linear correlation

If  $r = -1$ , negative linear correlation

If  $r = 0$ , no linear correlation

limitation:

### 5.4 Coding

does not effect  $r$

## 6 Regression

### 6.1 Linear

let  $y = a + bx$  be a regression line  
where

$$b = \frac{S_{xy}}{S_{xx}} \text{ and } a = \bar{y} - b\bar{x}$$

### 6.2 Coding

### 6.3 Interpolation and Extrapolation

## 7 Discrete random variables

### 7.1 Probability distribution

**Definition** (Mean / Expected value).

$$E(X) = \sum xp(x)$$

when we find  $E(X^n)$ :

$$E(X^n) = \sum x^n p(x)$$

**Definition** (Variable).

$$Var(X) = E(X^2) - (E(X))^2$$

The constant  $a$  and  $b$  affect on  $E(X)$  and  $Var(X)$

$$E(aX + b) = aE(x) + b$$

$$Var(aX + b) = a^2 Var(X)$$

**Definition** (Uniform distribution). The distribution is uniform when all the probabilities is the same of all values.

## 8 The normal distribution

$Z \sim N(\mu, \sigma^2)$  represent the normal distribution.

The random variable  $X$  can be written as  $X \sim N(\mu, \sigma^2)$

you can transform  $X$  to  $Z$  by this formula

$$z = \frac{X - \mu}{\sigma}$$

**Example.** Example 8-9

## 9 Binomial distribution

## 10 Poisson distribution

## 11 Continuous random variables

## 12 Continuous uniform distribution

## 13 Normal approximation

## 14 Population and samples

## 15 Hypothesis testing

## 16 Combination of random variables

## 17 Sampling

## 18 Estimation , confidence intervals and tests

## 19 Goodness of fit and contingency tables

## 20 Regression and correlation

## 21 Quality of tests and estimators

## 22 One-sample procedures

## 23 Two-sample procedures
